

POMI

Collector

Removes horse manure from the fields. Gathers fallen leaves.

The brushes rotate when the machine is pulled forward. Attach it to an ATV or a small tractor and you're ready to clear your grass areas, the easy way. The machine is available in work width 0,7 meter and 1,0 meters. 0,7 meters model are available as mechanical or hydraulic rotation of brushes and the 1,0 meters models are only available as hydraulic driven.

Drive the collector over the horse manure to remove it – it's that simple. The container is emptied with an electric actuator which is activated by pressing a button fitted on the ATV.

All horse owners are aware of this but not everyone gets it done: Horse manure should be removed from the field on a daily basis. In particular, this should be done to avoid worms but also to avoid the raw vegetation that grows where the horses defecate.

The collector is an efficient solution to collecting horse manure, alpaca manure, goose manure, fallen leaves, sticks and other debris and will give you unprecedented productivity while saving you hours of backbreaking work.
